It forms part of 'The Prehistoric Settlement at Heraion on Samos (Sacred Road)' research project being carried out by Assoc. Prof. Ourania Kouka since 2009 (University of Cyprus). Originally, a pilot fabric study was conducted on 44 ceramic samples from the EBA II late-III levels (ca. 2500-2000 BC), corresponding to five architectural phases (Heraion I-V) as defined by Milojčić (1961, SAMOS I). The petrographic analysis complemented macroscopic observations and typological-stylistic evaluations, and allowed a detailed characterisation of the samples with respect to textural and mineralogical data. The analytical results revealed preliminary information regarding issues of technology, as well as of geological and/or geographical provenance. This study, undertaken in the framework of an MSc dissertation, formed a firm basis and was further extended into a PhD project that included an integrated examination of pottery recovered from the old (1981) and the recent (2009-2013) excavations in the area north of the Sacred Road.

RAUM & ZEIT

FORSCHUNG

The methods followed were focused on analysing the full spectrum across all three ceramic assemblages (1953/1955 in the area of the Hera Temple; 1981 and 2009-2013 in the area north of the Sacred Road) that is to cover the range of wares, fabrics, and shapes/types in a combination of macroscopic, microscopic, microstructural and chemical observations. The data derived were combined with information on chronology and settlement phasing, geology/geomorphology of the island, and contextual analysis. The various levels of analysis include:

KULTURERHALT

VERNETZUNG

ERGEBNISSE

The integrated study of pottery from Heraion and the combination of three ceramic assemblages from the old and new excavations has allowed the creation of a complete ceramic

environs of settlement itself. The majority of the pottery dated to the early phases of the EBA fall into the metamorphic fabric(s), which comprise more than half of the total analysed samples. Combined with the macroscopic information, the petrographic analysis revealed some important associations between shape, assumed function, fabric, and ware. In the subsequent period there emerges a more varied picture with fabrics used for the manufacture of particular vessel types or even a range of similar fabrics that could reflect the existence of several production centres that produce the same types in similar or different recipes. This could point out distinct manufacturing traditions and markedly different clays that can be explained from a chronological and technological perspective. Furthermore, the wealth of ceramic evidence at Heraion presented us with the potential to also explore inter-site relations at a regional level through comparative examination of thin sections from other sites and an extensive bibliographical research on form/finish/fabric comparanda and vessel parallels from across the Aegean and Anatolia during the EBA.
